Correct Answer

Score 105

Between Two Sets > Coding

Math Algorithms Easy gcd Data Structures LCM sets

problem-solving Core CS greatest common divisor Least Common Multiple

QUESTION DESCRIPTION

There will be two arrays of integers. Determine all integers that satisfy the following two conditions:  
1. The elements of the first array are all factors of the integer being considered  
2. The integer being considered is a factor of all elements of the second array

These numbers are referred to as being *between* the two arrays. Determine how many such numbers exist.

**Example**

$a = [2, 6]$   
 $b = [24, 36]$

There are two numbers between the arrays: **6** and **12**.

$6\%2 = 0$ ,  $6\%6 = 0$ ,  $24\%6 = 0$  and  $36\%6 = 0$  for the first value.

$12\%2 = 0$ ,  $12\%6 = 0$  and  $24\%12 = 0$ ,  $36\%12 = 0$  for the second value. Return **2**.

**Function Description**

Complete the *getTotalX* function in the editor below. It should return the number of integers that are between the sets.

getTotalX has the following parameter(s):

- *int a[n]*: an array of integers
- *int b[m]*: an array of integers

**Returns**

- *int*: the number of integers that are between the sets

**Input Format**

The first line contains two space-separated integers, *n* and *m*, the number of elements in arrays *a* and *b*.

The second line contains *n* distinct space-separated integers *a[i]* where  $0 \leq i < n$ .

The third line contains *m* distinct space-separated integers *b[j]* where  $0 \leq j < m$ .

**Constraints**

- $1 \leq n, m \leq 10$
- $1 \leq a[i] \leq 100$
- $1 \leq b[j] \leq 100$

**Sample Input**

```
2 3
2 4
16 32 96
```

**Sample Output**

```
3
```

**Explanation**

2 and 4 divide evenly into 4, 8, 12 and 16.

4, 8 and 16 divide evenly into 16, 32, 96.

4, 8 and 16 are the only three numbers for which each element of a is a factor and each is a factor of all elements of b.

**CANDIDATE ANSWER**

Language used: **C++14**

```
1
2 /*
3  * Complete the 'getTotalX' function below.
4  *
5  * The function is expected to return an INTEGER.
6  * The function accepts following parameters:
7  * 1. INTEGER_ARRAY a
8  * 2. INTEGER_ARRAY b
9  */
```

```

10 int getTotalX(vector<int> a, vector<int> b) {
11
12     sort(a.begin(), a.end());
13     sort(b.begin(), b.end());
14
15     int limit = b.at(0);
16     int first = a.at(0);
17     int start = 0;
18
19     vector<int> factors;
20     vector<int> ret_vec;
21
22     while (start < limit){
23         bool is_good = true;
24         start += first;
25         for (int i = 0; i<a.size(); i++){
26             if (start % a.at(i) > 0){
27                 is_good = false;
28             }
29         }
30         if (is_good) {factors.push_back(start);}
31     }
32
33     for (int i = 0; i<factors.size(); i++){
34         bool is_good = true;
35         int divide = factors.at(i);
36
37         for (int ii = 0; ii<b.size(); ii++){
38             if (b.at(ii) % divide > 0){
39                 is_good = false;
40             }
41         }
42
43         if (is_good) {ret_vec.push_back(divide);}
44     }
45
46     return ret_vec.size();
47 }
48
49

```
